

**Low fares,
our customers,
our people &
the environment
come first.**

***Your fare helps us
to plant trees.***

**We've planted
over 270,000 trees in
ten years.**

***We're in all the
major NZ cities and
still growing.***

- Low emission hybrid vehicles in all our cities.
- Zero-emission vehicles in-fleet.

***We live what we
preach.***

**We compost, carpool,
recycle, volunteer and
run paperless offices.**

We are proud partners of **Trees for Survival and Trees for the Future**

*We've been partners of
Trees for the Future for
over ten years.*

Anyone who can plant a tree for 10c a tree should get as much support as possible, so when you take a ride in a Green Cab you are helping to replant the planet, which improves the local environment and directly improves the quality of living for those in that environment.

For more information about
Trees for the Future visit
www.treesforthefuture.org

*We also support Trees
for Survival, a NZ based
environmental education
programme.*

Trees for Survival involves young people growing and planting native trees to help landowners revegetate erosion prone land. It helps improve stream flow and water quality, which increases biodiversity.

Got a question?

Are Green Cabs a health & safety certified and/or conscious organisation?

Absolutely, without a doubt. We are CM3 qualified, which is an internationally recognised Health & Safety accreditation. All of our team regularly attend Health & Safety and Civil Defence meetings, and as a business, company and team, we take Health & Safety seriously.

What types of vehicles does Green Cabs have in the fleet?

We use low emission vehicles across the fleet, and in some areas, we have vans. The majority of our fleet is the Toyota Camry Hybrid and the Toyota Prius Hybrid. We have also recently introduced the Nissan Leaf which was only the second EV taxi in the country!

How can Green Cabs claim to be 'green' when you still use petrol- powered vehicles?

We have reduced our emissions as much as possible by keeping low (or zero) emission vehicles in the fleet. We also actively offset our emissions by staying engaged in tree-planting programs and other green initiatives to support or offset carbon emissions.

Taxi company "X" is advertising that they are carbon zero. Why aren't Green Cabs?

We chose to work directly with a range of global, national and local charities who are working at the ground level to offset emissions, rather than to contribute to third parties.

How does a Hybrid actually work?

Hybrid engines - like the Prius and Camry types - are charged by the combustion engine and braking. Hybrids run on part battery power and part petrol power which means you never have to plug them in.

Our electric vehicles are 100% emission free and 100% electric. They usually reach full charge overnight, or via fast charger in around 30 minutes (depending on the car).
